Objective

This procedure is a non-destructive test designed to evaluate the lubricity of a two-cycle engine lubricant. This characteristic is evaluated by measuring the decrease in torque caused by the increase in spark plug temperature.

Summary of Procedure

The engine employed is an air-cooled, single cylinder Yamaha CE50S engine with the following general specifications:

| Displacement | 3.0 cu. in. (49 cm ³) |
|---------------|-----------------------------------|
| Cylinder Bore | 1.57 in. (40 mm) |
| Stroke | 1.54 in. (39.2 mm) |
| C ' D ' | 701 |

Compression Ratio 7.2:1

The engine is assembled before each test using new piston, rings, piston pin, gaskets, and spark plug. Since piston to cylinder wall clearance is critical to this procedure, it is measured and corrected when necessary.

A two-hour cyclic break-in is completed before each test begins. During conditioning runs which precede tightenings, the engine is stabilized at the following conditions:

| Engine, r/min | 4000 ± 30 |
|-----------------------------|---------------|
| Engine Load | W.O.T. |
| Spark Plug Gasket Temp., °C | 170 ± 1.1 |
| Reference Fuel/Oil Ratio | 150:1 |
| Candidate Fuel/Oil Ratio | 150:1 |

At a specified time, the cooling air is stopped and torque decrease (drop) is monitored as spark plug temperature rises. When the spark plug temperature reaches 350°C, cooling air is restored.

This procedure is repeated five times in each of two sets on both the reference and non-reference lubricants. Additional tightenings are made if an apparent out-of-line measurement is found (as a difference > 0.75 lbs. in. between maximum and minimum values in each set). The reference lubricant is run first and the non-reference immediately follows. The runs are then repeated in the same order. Thus, when the test is completed, there are at least ten values of torque drop for both the reference and the non-reference lubricants.

Upon completion of the test, the data is analyzed according to the Practice E178 for identifying outliers and the student's "T" test for differences between means.
