MEMORANDUM: 02-052
DATE: May 21, 2002
TO: Wim Van Dam, Chairman, Mack Surveillance Panel
FROM: Jeff Clark
SUBJECT: T-8 / T-8E Calibration Testing for the April 2002 ASTM Report Period

The following is a summary of T-8 / T-8E reference oil tests completed during the April 2002 ASTM report period, which began on October 1, 2001 and ended on March 31, 2002.

Lab / Stand Distribution:

	T-8 / T-8E Reporting Data	T-8 Calibrated as of 3/31/02	T-8E Calibrated as of 3/31/02
Number of Laboratories	3	2	2
Number of Stands	7	6	6

The figure below shows the T-8 / T-8E laboratory / stand distribution for tests completed this report period:

Laboratory / Stand Distribution

The table below summarizes the status of the reference oil tests reported to the TMC this ASTM report period:

Test Status	TMC Validity Code	Number of T-8 Tests	Number of T-8E Tests
Operationally and Statistically Acceptable	AC	7	7
Failed LTMS Acceptance Criteria	OC	0	0
Operationally Invalid	LC	0	0
Aborted	XC	5	5
Total		12	12

Calibrations per start, lost tests per start and rejections per start rates are summarized in the figure below:

The calibration per start rate shows some improvement compared to recent periods. The lost test per start rate is lower than recent periods and the rejection per start rates is comparable to historical levels. A detailed list of reasons tests failed the acceptance criteria is shown in Table 1. Table 2 lists the operationally invalid tests and Table 3 lists the aborted tests.

LTMS Acceptance Criteria / Stand Alarms:

The following figure shows the percentage of operationally valid tests that failed the LTMS acceptance criteria (TMC validity code = OC) for recent ASTM report periods:

There were no LTMS stand alarms for the current period. No LTMS deviations were issued this period. A total of two LTMS deviations have been issued during the history of the T-8 / T-8E.

Severity and Precision:

Figure 1 (attached) shows the current industry EWMA severity, EWMA precision, and cusum charts for Viscosity Increase at 3.8% TGA Soot (VI38). VI38 is currently in control. For this period, VI38 is trending an average of 0.46 Δ /s mild. This is equivalent to 0.41 cSt. Figure 2 (attached) shows the industry charts for the most recent twenty-five tests. For a history of VI38 industry alarms, refer to the industry alarm log shown in Table 4.

Figure 3 (attached) shows the current industry EWMA severity, EWMA precision, and cusum charts for Relative Viscosity at 4.8% TGA Soot (RV48). RV48 is currently in control. For this period, RV48 is trending an average of 0.47 Δ /s mild. This is equivalent to 0.12 relative viscosity units. Figure 4 shows the industry charts for the most recent twenty-five tests. For a history of RV48 industry alarms, refer to the industry alarm log shown in Table 5.

Effective March 6, 2002, the TMC began monitoring a second relative viscosity parameter. The new parameter uses 100% of the DIN Shear Loss to calculate the relative viscosity and it is used for the CI-4 specification. This parameter is not used for determining stand calibration status; it is monitored for determining severity adjustments only. Figure 5 (attached) shows the current industry EWMA severity, EWMA precision, and cusum charts for Relative Viscosity at 4.8% TGA Soot, 100% Din Shear Loss (RV2). RV2 is currently in control. Figure 6 shows the industry charts for the most recent twenty-five tests. For a history of RV2 industry alarms, refer to the industry alarm log shown in Table 6.

Precision, as estimated by the pooled standard deviation, is shown in the following figures. For comparison purposes, the TMC will continue to report precision by ASTM period.

VI38 Pooled Precision

RV48 Pooled Precision

RV2 Pooled Precision

The April '02 precision estimates for all three parameters are within historical levels and continue to show improvement compared to recent ASTM periods. Please note, that the degrees of freedom (df) equals Σ (n observations per oil - 1).

Reference Oils:

The current T-8 / T-8E reference oil test targets are shown below:

Oil	n	Parameter	Mean (cSt)	s
1004-3	30	VI38	4.57	0.90
		RV48	2.07	0.26
		RV2	2.21	0.27

Information Letters:

No information letters were issued this ASTM period.

TMC Laboratory Visits:

No TMC laboratory visits were conducted this ASTM period.

Additional Information:

Figure 7 is a plot of TGA soot versus test hours for all operationally valid calibration tests on TMC oil 1004-3

Table 7 contains the T-8 / T-8E Timeline which details changes to the test since January 1, 1993.

The T-8 / T-8E database, for operationally valid calibration tests, can be accessed on the TMC's homepage. If you have any questions on how to access this information, contact the TMC.

T8 INDUSTRY OPERATIONALLY VALID DATA

VISCOSITY INCREASE AT 3.8% SOOT

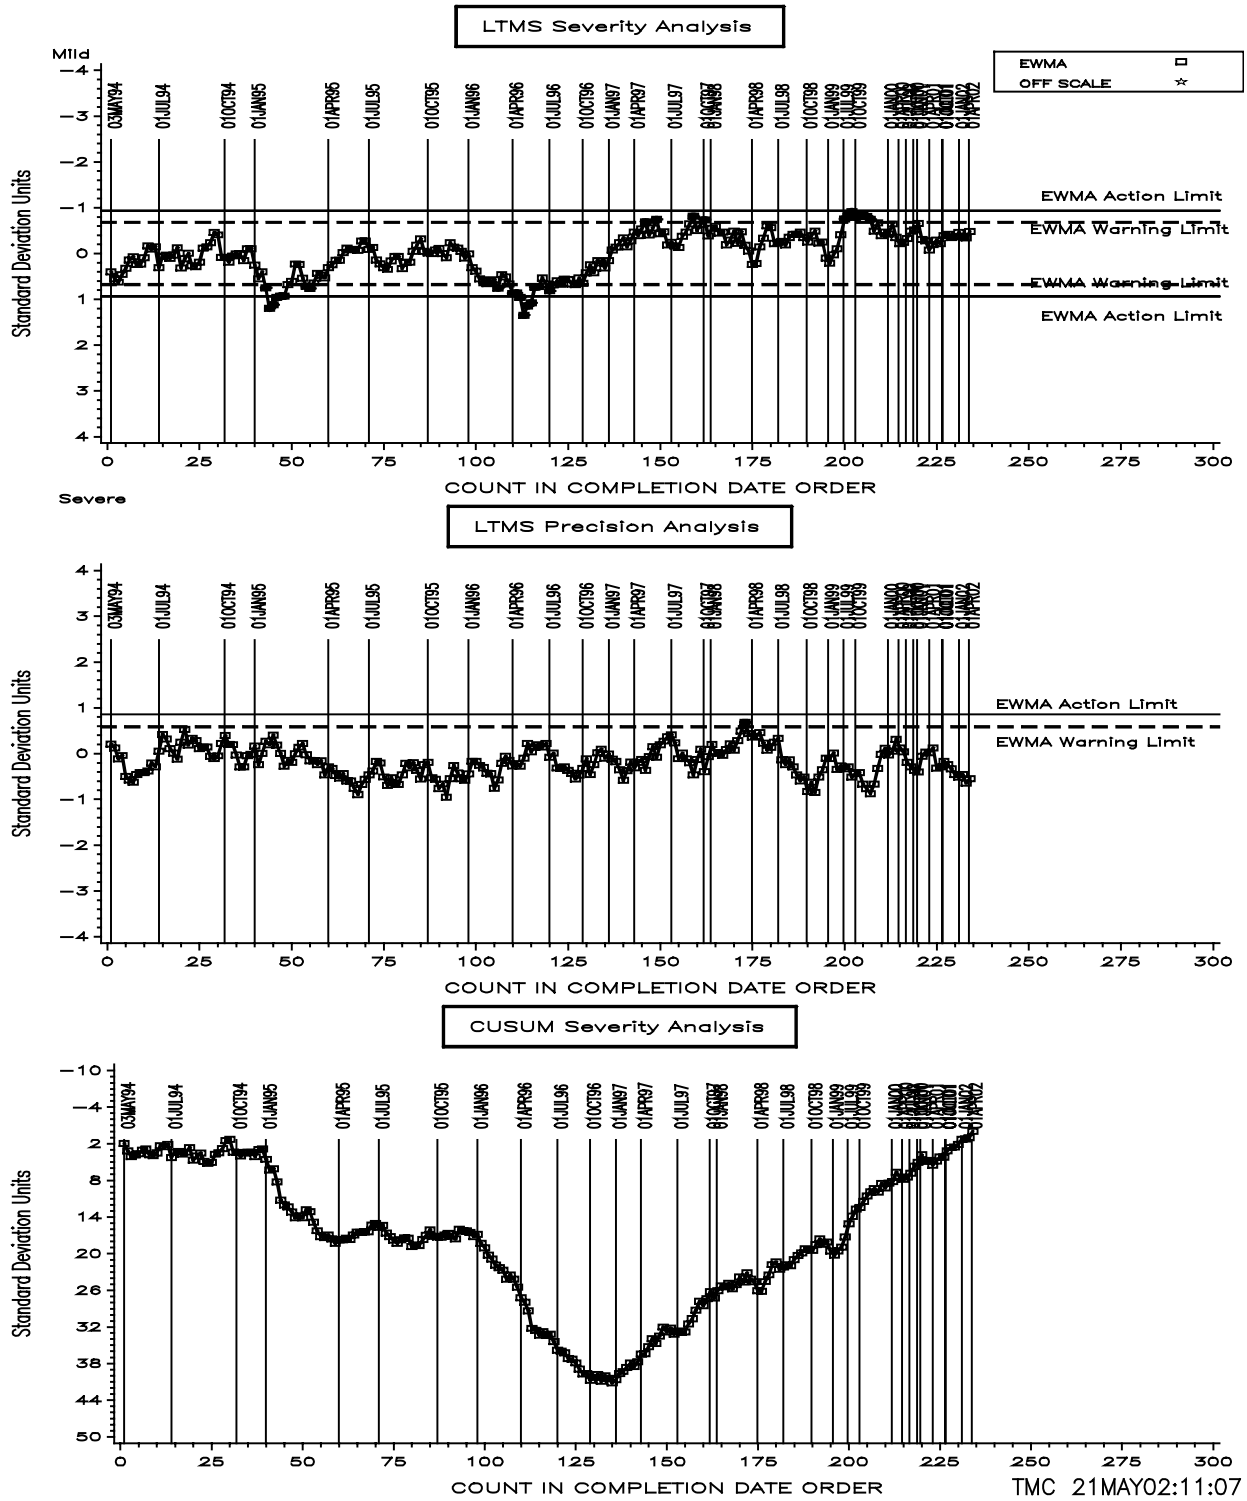

Figure 2

T8 INDUSTRY OPERATIONALLY VALID DATA

VISCOSITY INCREASE AT 3.8% SOOT

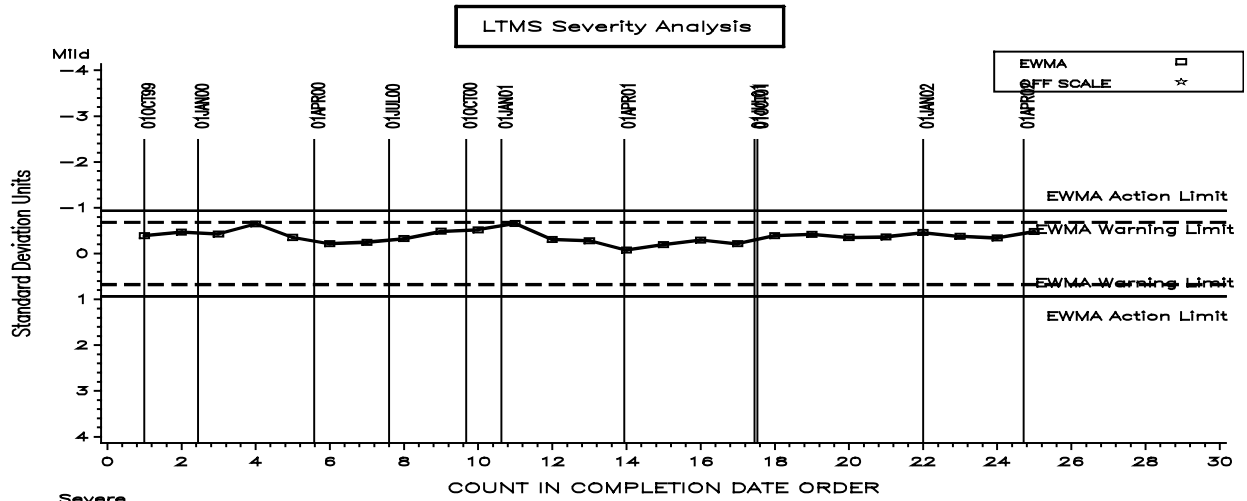

Table 4

T-8 / T-8E VISCOSITY INCREASE AT 3.8% SOOT INDUSTRY ALARM LOG

January 21, 1995 to March 14, 1995 (Severity, Severe direction)

Surveillance investigated effects of fuel batches at April and June 1995 meetings. No cause was identified.

February 3, 1996 to October 25, 1996 (Severity, Severe direction)

Surveillance investigated alarms at June and September 1996 meetings. Alarms believed to be caused by the test trending mild on soot. Concerned that existing test targets did not represent true test performance, the Surveillance Panel adopted new targets on September 5, 1996. Alarms cleared on October 25, 1996.

May 6, 1997 to June 4, 1997 (Severity, Mild direction)

Industry mild trend believed to be caused by one laboratory's data.

August 17, 1997 to November 28, 1997 (Severity, Mild direction)

Industry mild trend believed to be caused by one laboratory's data.

March 23, 1998 to March 24, 1998 (Precision)

A one-test excursion occurs. No industry related problem.

September 1, 1999 to November 25, 1999 (Severity, Mild direction)

A series of mild tests triggered an industry warning. No causes were identified and the Surveillance Panel took no action.

Updated 5/21/02

Figure 3

T8 INDUSTRY OPERATIONALLY VALID DATA

RELATIVE VISCOSITY AT 4.8% SOOT

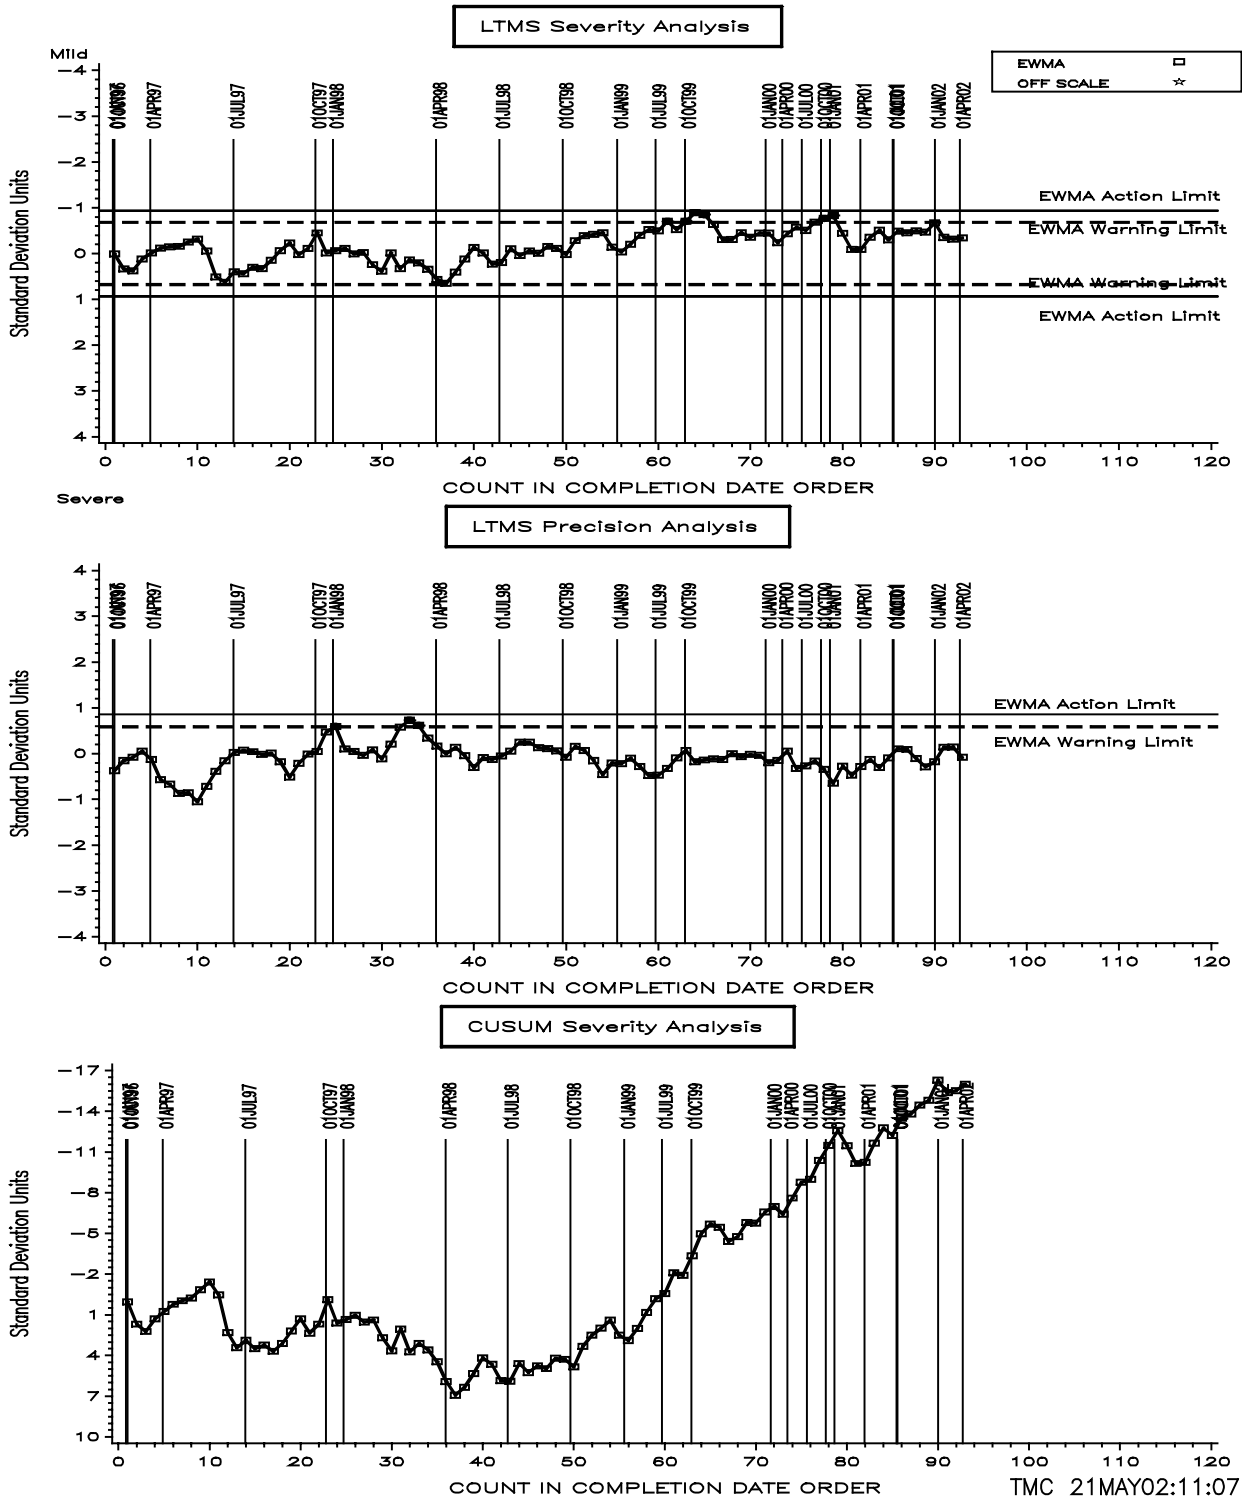

Figure 4

T8 INDUSTRY OPERATIONALLY VALID DATA

RELATIVE VISCOSITY AT 4.8% SOOT

Table 5

T-8E RELATIVE VISCOSITY AT 4.8% SOOT INDUSTRY ALARM LOG

February 1, 1998 to February 12, 1998 (Precision)

A one-test excursion occurs. No industry related problem.

March 21, 1998 to March 24, 1998 (Precision)

A two-test excursion occurs. No industry related problem.

September 16, 1999 to October 21, 1999 (Severity, Mild direction)

Four of five tests trigger a warning alarm. No causes were identified and the Surveillance Panel took no action.

November 6, 2000 to February 22, 2001 (Severity, Mild direction)

A two-test excursion occurs. No industry related problem.

Updated 5/21/02

TGA Soot vs. Test Hours
TMC Oil 1004-3

TABLE 7 T-8 / T-8E TIMELINE

Date	I.L.	Topic
19940316, 94-1,	End of Test Soot Window set to 4.0% - 4.6% for oil 1004-1	
19940401,	Oil 1004-1 Thirty-test Targets	
19940401, 94-1,	Acceptance Bands with Shewhart Severity k=1.75	
19940602, 94-1,	Kinematic Viscosity at 100° C Measurement procedure added to test procedure	
19940602, 94-1,	Enhanced Detroit Diesel TGA Soot Procedure added to test procedure	
19940727, 94-1,	Data Dictionary and Report Form Revisions - Version 19940615	
19940811,	Viscosity measurement both soak window changed to ± 30 seconds	
19950101, 95-1,	LTMS used for test acceptance	
19950101, 95-1,	Post Test flush oil specified as Bulldog Premium Oil	
19950101, 95-1,	Post Test Solvent Wash - oil pan is to be solvent cleaned	
19950603, 95-1,	Data Dictionary and Report Form Revisions - Version 19950321	
19950614, 95-2,	End of Test Soot Window set to 4.0% - 4.8% for oil 1004-2	
19950619,	Oil 1004-2 Ten-test Targets uses std. dev from 1004-1 of 1.19	
19951101,	Oil 1004-2 Twenty-test Targets uses std. dev. from 1004-1 of 1.19	
19960201,	Oil 1004-2 Thirty-test Targets uses std. dev. from 1004-1 of 1.19	
19960628, 96-1,	Correction to Oil Consumption calculation	
19960815, 96-1,	Data Dictionary and Report Form Revisions - Version 19960122	
19961001,	Oil 1004-2 Fifty-Nine Test Targets uses std. dev. of 0.93 from oil 1004-2	
19970407, 97-1,	Reference test length increased to 300 hours.	
19970407, 97-1,	Calibration period increased to 3000 hours.	
19971001, 97-1,	Data Dictionary and Report Form Revisions - Version 19970702	
19971208, 98-1,	T-8E incorporated into Test Method D 5967	
19980303, 98-2,	Oil samples at 25, 75, and 125 h are mandatory for reference oil tests, optional for non-reference oil tests. These samples are not used for calculation of VI38 and RV48	
19980316, 98-1,	Data Dictionary and Report Form Revisions - Version 19980122	
19980501,	Oil 1004-3 Ten-test Targets	
19980622, 98-3,	Mack primary and secondary filters specified for fuel system.	
19980622, 98-3,	DIN Test Method number changed from D 3945 to D 6278.	
19980622, 98-3,	Viscosity measurement procedure revised.	
19980803, 98-2,	Data Dictionary and Report Form Revisions - Version 19980624	
19980914,	Oil 1004-3 Twenty-two test Targets	
19980928, 98-3,	Data Dictionary and Report Form Revisions - Version 19980818	
19981001, 98-4,	Critical parts list redefined, critical parts to be obtained from TEI	
19981211, 98-5,	T-8A incorporated into Test Method D 5967	
19990129, 98-5,	Data Dictionary and Report Form Revisions - Version 19981027	
19990201,	Oil 1004-3 Thirty test targets	
20020215,	Data Dictionary and Report Form Revisions - Version 20020107	
20020306,	100% Din Shear Loss Relative Viscosity monitoring begins for T-8E (severity adjustments only)
