Hardware usage guidelines

All materials used in this test must conform to acceptance guidelines as specified in the ASTM Sequence IIIG Test Method D 7320 accompanied by the direction and information contained in this Assembly Manual.

Any changes in procedures or substitutions of qualified parts or materials, must be approved by the Sequence IIIF / G Surveillance Panel prior to their use in non-reference and reference oil tests.

Any parts or materials specified in this document that are found to be unacceptable for testing, both pre and post test, must be reported to the Test Sponsor, the appropriate Critical Parts Distributor, and the ASTM Test Monitoring Center.

Unless otherwise directed, all parts and materials required for testing should be stored and used on a first in – first out basis following the guidelines outlined in the ASTM Test Monitoring Center Sequence IID and IIIE Information Letter #60 June 21, 1991.

Section 1

Cleaning and Pre Hone Preparation

Description of Operation	
A	Upon introduction of a new block into the system, check for any damage to machined surfaces which might have occurred during shipping or handling. Optional: Check crankshaft main bore alignment using appropriate mandrel.
B	Remove main cap side & main bolts. Use Kent-Moore J-41348 main bearing cap puller (12Nm) & J-6125-1B slide hammer to remove main caps. Note: Main bearing caps are press fit. Do not hammer caps back and forth during removal. Damage to the caps may result in damage to engine bearings during test.
C	Record engine serial number and or assign a laboratory number and mark necessary identification on engine block and crankshaft main caps. Note: Do not use stamped tool set for marking identification on main caps.

Description of Operation

- A Remove all casting slag and core sand deposits from the coolant passages on new blocks and check for core sand deposits on used blocks
- B Remove all camshaft bearings and oil gallery plugs.
- C Clean all gasket surfaces.
- D Chase all threaded holes for the main caps and cylinder head fasteners using a Class 2B Tap.
- E Remove bearings, and oil gallery plugs and main caps prior to cleaning.
- F Install coolant core plugs, GM part #24500867.
- G Ream dip stick hole using OHT3F-071-1

New Block and Pre-Hone Prep		Sequence IIIG	Section	Sheet
			1	5A

Description of Operation

- A Clean and oil all main cap fasteners (EF-411) and install main caps (use used fasteners for honing). Note: Do not use air tools to run main caps down.
- B Install main cap with fasteners as guides and draw into position with speed handle and socket in crisscross pattern.
- Y
 - 1.) Tighten all main fasteners to 70 N·m to fully seat main caps
 - 2.) Loosen the fasteners 360° counterclockwise.
 - 3.) Starting from the center of the block and moving out torque the fasteners 20 N·m, then 40 N·m
 - 4.) Starting from the center of the block and moving out for each of the steps shown below tighten fasteners in the following steps: 35°, another 35° and finally to another 35°
- C Install main cap side fasteners, torque to 15 N·m, and then an additional 45°

Specification

- 1 24503056 Bolt (8) see note Y (Tighten before Z)

Sequence III G

Spray engine with 50/50
Solution EF-411 / Degreasing Solvent

A B

Coat with
EF-411

Description of Operation

- A The engine shall be cleaned using an automated washing device, however, caution should be used to prevent oxidation flash over of the ferrous surfaces. Note: Only use specified cleaning materials, refer to section 7.5 of ASTM D7320 for approved cleaning materials.
- B The block must be thoroughly cleaned using brushes through the oil galleries, camshaft tunnel, and cylinder bores with degreasing solvent to remove any detergent residue before honing.
- ? (Step Sec. 1 sheet 6)
Repeat step "A & B" above after honing.
- Note: If this is the final cleaning after honing, spray the entire engine block using a 50/50 solution of EF-411 and degreasing solvent. Air dry to remove excess solution.

Honing Operations Guide

EHU-512 Stones (**Ratchet Feed Set to 1**) (**Block must be at room temperature before honing**)

- 1 Insert hone head into cylinder and rotate feed handle to the left while shaking the hone head until a slight resistance is felt.
- 2 Adjust the feed dial to a point where it will not shut off the hone over fifteen strokes
- 3 Set mode switch to timed mode and set controller to 15 seconds (15 seconds = 15 strokes)
- 4 Start the hone and adjust the load to a minimum of 15 units, but not to exceed 20 units load during honing.
Apply no more than 15 strokes per cylinder at a time. (4 strokes minimum during final sizing).
Switch stone positions in the hone head between each cylinder.
Do not dwell machine when cylinder is within 0.01mm of target size.

Note 1: During final sizing, if less than 15 strokes are desired, set timer to desired seconds or operate in zero shut-off mode and never dwell machine or run less than 4 strokes / cylinder.

- 5 Follow recommended honing sequence (1,5,4,-3,2,6) do not hone adjacent cylinders
- 6 Size cylinders, 15 strokes / cylinder maximum, switching stone positions in hone head between each cylinder. Do not chase taper (dwell machine) when cylinder size is within 0.01mm of target. Stop honing with the EHU-512 stones when cylinder size is within 0.005mm of target size. Allow block to cool for fifteen minutes to confirm final size before brush honing.

OHT3G-096-1 Plateau Honing Tool (**Ratchet Feed Set to 4**)

- 1 Insert hone head into cylinder and rotate feed handle to the left while shaking the hone head until a slight resistance is felt.
- 2 Adjust feed dial so it will not shut the machine off before the control panel timer.
- 3 Set mode switch to timed mode and set controller to 45 seconds.
- 4 Start honer and increase unit load to 20 units and allow to run until system shuts off.

Note:2 Proper ratchet feed setting is required to establish desired cylinder surface parameters using the OHT3G-096-1 Plateau Hone Tool. After setting the initial load, the ratchet feed system will increase the load during the remaining time. Operators should not release load during this operation.

Description of Operation

Use LP8X-55 Chlorine free fluid set at 7L/min. flow rate. Use dual canister filtration system with honing mats CV-1100. Change filters, fluid, and mats every 15 hours of operation.

See Section 2 Sheets 10 and 11 for honer calibration and maintenance requirements.

Honing Sequence

Note: When honing first run blocks, stroke limitations due not apply until cylinder size is within 0.0254mm (0.001in) of target size.

Description of Operation

A Confirm run number and proper grade piston selections.

Clean pistons with degreasing solvent followed by air dry and wipe with lint-free cloth.

Clean rods by soaking in degreasing solvent for two hours followed by spray with 50/50 EF411 and degreasing solvent.

Lubricate piston pin and connecting rod with EF-411. Install one piston pin retainer clip into the retaining groove.

B Install the con rod and piston pin. (Note: dimple on con rod is for manufacturing only) Install the second retainer clip. Make sure both retainer clips are properly seated in their grooves.

Cylinder Head and Valves

- 1 VALVE STEM KEY
- 2 VALVE SPRING CAP
- 3 VALVE SPRING
- 4 VALVE STEM SEAL
- 5 VALVE
- 6 CYLINDER HEAD CASTING

During calibration, use OHT3F-070-1 Sleeve to protect seals from being cut and OHT3F-072, 006", 010", 015", & 020" shims to assist in

Description of Operation

Clean cylinder head by automated parts washer (see section 1 sheet 5A) or with degreasing solvent and spray with 50/50 solution of EF-411 and degreasing solvent. Remove excess solution using compressed air.

Lubricate valve stems and guides with EF-411 during assembly. Ensure valve stem moves freely in guide before installing valve seal. Use a protective sheath over the valve stem that extends downward past the keeper grooves when installing the valve stem seals.

Install the valve springs, retainers, and keepers.

Calibrate the valve spring load to 912N +/- 44N @ 9.5mm (205lbf +/- 10lbf @ 0.375in.) travel.

Section 5a

Cylinder Head Part Number 24502260S and Valves

Description of Operation

Prior to use, determine baseline for valve recession by measuring the seat depth using a valve with a 0.321 diameter ball afixed to the center of the valve. Remove a minimum of 1/2 inch of the valve stem to preclude valve stem from pertruding beyond the top of the guide.

Measure the baseline valve set depth to the nearest thousandth (0.001) inch using a Mitutoyo model 329-711-10 or 329-350-10 depth micrometer.

Head Assembly		Sequence IIIG		Section
				5a
				Sheet
				2

Description of Operation

Remove any remaining gasket material from the deck surface. Do not use sandpaper, scotchbrite or other abrasives which could transfer to the head surface.

Using a straight edge, measure the clearance between the straight edge and the head with a feeler gauge. Maximum .004"

Spray head with degreasing solvent and dry with compressed air. Wash heads in power washer for 30 minutes, or use ultra sonic cleaner for 30 minutes to remove debris from combustion chamber and intake and exhaust ports.

Rinse with hot water and immediately spray with 50-50 mixture of degreasing solvent and EF411

Section 8

OH Technologies Special Engine Dress

Description of Operation

Water cooled exhaust manifold end plates and exhaust manifold transitions. Note: both views are right side showing the cooling water inlet is the lower port and the outlet is the higher port. Also, the inboard exhaust sample port is typically for the gas analysis and the outboard is for the back pressure connection.

The transition should be connected with shielded gaskets not shown but identified by part number. Two required per side.

Thermocouples for exhaust coolant in and out should be installed in the fittings attached to the front plate and centered in the coolant flow.

Specification

- 1 OHT3F-006-1 Plate, Rear Exhaust
- 2 OHT3F-005-1 Plate, Front Exhaust
- 3 OHT3F-004-1 Runner, Exh. Man.

Note: See section 8 sheet 3a & 3b for additional information

Description of Operation

- A Replace "O"-rings every test.

Note: View A
Viewed from front or oil filter side, passages are, IN (oil pump pressure to filter), center port for temperature control thermocouple, OUT (oil flow out of filter in to engine block), Side outlet to external oil by-pass valve, and lower port is for oil sample valve.
- B Replace oil cooler every test

Specification

- 1 OHT3F-030-2 Cooler Nickel Plated
- 2 OHT3F-039-3 Connector Special Cut
- 3 OHT3F-035-2 Adapter, Oil Filter
- 4 OHT3F-043-2 Fitting, Oil Filter Adapter
