

**Sequence VH Surveillance Panel Call
October 24, 2024, Webex**

Roll Call:

Afton:	B. Maddock, A. Stone
Ford:	M. Deegan, R. Zdrodowski
GM	T. Cushing, B. Cosgrove
Haltermann:	W. Hairston, E. Hennessy, I. Mathur
IMTS:	S. Clarke, D. Passmore
Infineum:	J. Anthony, T. Dvorak, A. Ritchie (Chair)
Intertek:	A. Lopez
Lubrizol:	T. Catanese
OHT:	J. Bowden
Oronite:	R. Affinito, R. Stockwell
SwRI:	D. Engstrom, T. Kostan, P. Lang, M. Lochte
TEI:	D. Lanctot
TMC:	R. Grundza
Valvoline:	A. Sawant

Chair's Comments

- Meeting minutes from 10/10 are posted.
- Chair Ritchie started the meeting and outlined the agenda items:
 - 1) Fuel Inventory & New Batch Status
 - 2) ICF proposal
 - 3) Old Business
 - 4) New Business

Fuel Inventory & New Batch Status

Test Stand Activity:

- IAR ran 6 tests in October.
 - Ordered another tanker of fuel, which is 10 tests, and will order another load in December.
 - IAR has 3 tests worth of fuel on site and will start running on high-gravity fuel in November.
- Lubrizol will receive drums of high gravity fuel next week and will run a fuel dilution experiment and calibration test November.
- SwRI has 4-6 weeks of test fuel on site.
 - SwRI ran 6 tests in October.
 - Plans to run 8 tests in November after bringing a 4th stand online.
- Valvoline has not run any tests recently and does not have any tests scheduled.
- Afton is running 4 tests/month.
- Industry is at capacity, about 14 test per month and could go up to 20 tests/month with new stands coming online.

New Fuel Batch Status:

- Haltermann has sent the contract.
 - Labs are reviewing contract for final approval.
- Haltermann has started blending the new batch and will have more detail by next meeting.
- Batch is being blended in new tank.
- Should be ready for matrix by late November.

ICF Discussion

- Ford asked the SP to consider Afton's ICF proposal.
- Afton's statistician presented slides to gauge the interest of the SP in applying an ICF to account for the severe calibration results at Lab A & Lab G.
 - Pro:
 - Allows labs with severe calibration results calibrate stands more easily.
 - Cons:
 - Applying an ICF to results that are still trending down does not accurately represent the performance of the test.
 - An ICF will allow labs to calibrate, but the SA's will continue to grow and not accurately represent the performance of candidates.
- A majority of SP members, including TMC, believe that the industry should continue testing with this fuel batch without an ICF since the supply will be exhausted in a few more months.
- TMC Comments:
 - Fuel degradation over time has happened with past Sequence V fuel batches.
 - The degradation was not as noticeable while using the DJ batch because half of the fuel was used for VG.
 - An ICF will correct the current results but will not be accurate for results that are trending on the same direction.
 - ICF is to help labs calibrate but will not help candidates.
 - It is possible that the stand differences are exacerbating the issue.
- SwRI believes applying an ICF will allow the results to drift further from target instead of being capped by the SA limit.
- Infineum's statistician showed a chart indicating that an ICF would not address the lab differences.
- Oronite believes all the labs verified calibration test results should be considered valid whether or not they are on target.
 - Agrees that more calibration tests may be a good solution to reduce SA lag and produce more data to determine the source of severity.
- There was no consensus from the SP that an ICF should be pursued further.
- The statisticians agreed to research further options to address the severity drift.

Old Business:

New Business:

The meeting ended at 10:00 am EDT.
The next meeting will be held on 11/7/2024 9am EDT.

VH FUEL SEVERITY

November 7, 2024

Stats Group

- Amanda Stone, Afton/New Market
- Amy Ross, Valvoline
- Jo Martinez, Chevron Oronite
- Martin Chadwick, Intertek
- Phil Scinto, Lubrizol
- Ricardo Affinito, Chevron Oronite
- Rich Grundza, TMC
- Seth Demel, Shell
- Todd Dvorak, Infineum
- Travis Kostan, SwRI

Summary of Options

1. Do nothing and allow the SAs to carry the fuel severity for the remainder of the fuel batch.
2. Implement an AES ICF of 0.36 for fuel batch lots N-000010-11 and later. Total adjustment (ICF+SA) will be capped at 1.8 standard deviations, which would be 0.90 for AES.
 - This analysis is excluding the 3 recent extreme results.
3. Implement an ICF of 0.64 for AES, an ICF of 0.14 for AEV50, and an ICF of -0.23 for RAC (transformed) for fuel batch lots N-000010-11 and later.
 - This analysis is including all valid AC, AF, and OC results.
 - This option is not recommended by the statistics group.

Statistically Significant Differences in Fuel Batches

- Batches N-00010-11+ show as significantly different from previous batches for AES when we include all data and when we exclude the 3 recent extreme points
 - AES plot shown below, additional plots in Appendix

	w/o Green	ICF	P-Value
AES		0.36	0.0166
AEV ₅₀		--	0.2588
APV ₅₀		--	0.8128
RAC (Transformed)		--	0.1782

	All Data	ICF	P-Value
AES		0.64	0.0002
AEV ₅₀		0.14	0.0208
APV ₅₀		--	0.5556
RAC (Transformed)		-0.23	0.0175

AES Before and After Proposed ICF Options

- Since batch N-000010-11 all but two references have been below target.
- Both ICF options improve AES yi balance

Summary of Options

1. Do nothing and allow the SAs to carry the fuel severity for the remainder of the fuel batch.
2. Implement an AES ICF of 0.36 for fuel batch lots N-000010-11 and later. Total adjustment (ICF+SA) will be capped at 1.8 standard deviations, which would be 0.90 for AES.
 - This analysis is excluding the 3 recent extreme results.
3. Implement an ICF of 0.64 for AES, an ICF of 0.14 for AEV50, and an ICF of -0.23 for RAC (transformed) for fuel batch lots N-000010-11 and later.
 - This analysis is including all valid AC, AF, and OC results.
 - This option is not recommended by the statistics group.
