L42-1 updates

Discussion concerning Conditioning 1 & 3

Labs concerned about the Torque spec that is currently in place for conditioning 1&3. The labs are seeing anywhere from 5-10% out on torque limits for cond 1&3. The temperature spec is also a concern. During Conditioning 4 it is possible for the temperature to fall below the 220°F threshold. The labs can cool an axle, but the control systems are not fast enough, nor can they heat the axle to keep it above 220°F during the cyclic phases.

All labs to determine how they are calculating test length by January 28th (next conf call)

Don Lind to provide a chart which shows torque vs score % by lab

AI-Chairman to reserve room at PRI for Tuesday February 7th.
